Building the Bridge Festival App: Web3 Ticketing Meets Real-World Scale

EXIT Festival is a multiple award-winning European music festival, recognized as one of the best festivals in the world. Founded in 2000, it has evolved into a globally renowned cultural brand, attracting audiences from over 100 countries. Deeply rooted in strong values, EXIT promotes freedom, tolerance, sustainability, and social responsibility.

Why (The Purpose & Challenge)

For one of Europe's most iconic festivals, EXIT Festival, the challenge was clear:

how to modernize festival ticketing and fan engagement without compromising scale, security, or user experience.

Traditional ticketing systems struggle with:

- **Fraud and ticket scalping**
- **Limited post-purchase engagement**
- **Lack of transparency in secondary markets**
- **Fragmented user journeys (ticketing, payments, social, loyalty)**

EXIT's ambition went beyond incremental improvement. The goal was to set a new industry standard by introducing on-chain ticketing, digital ownership (NFTs), and a future-ready festival ecosystem, powered by Avalanche.

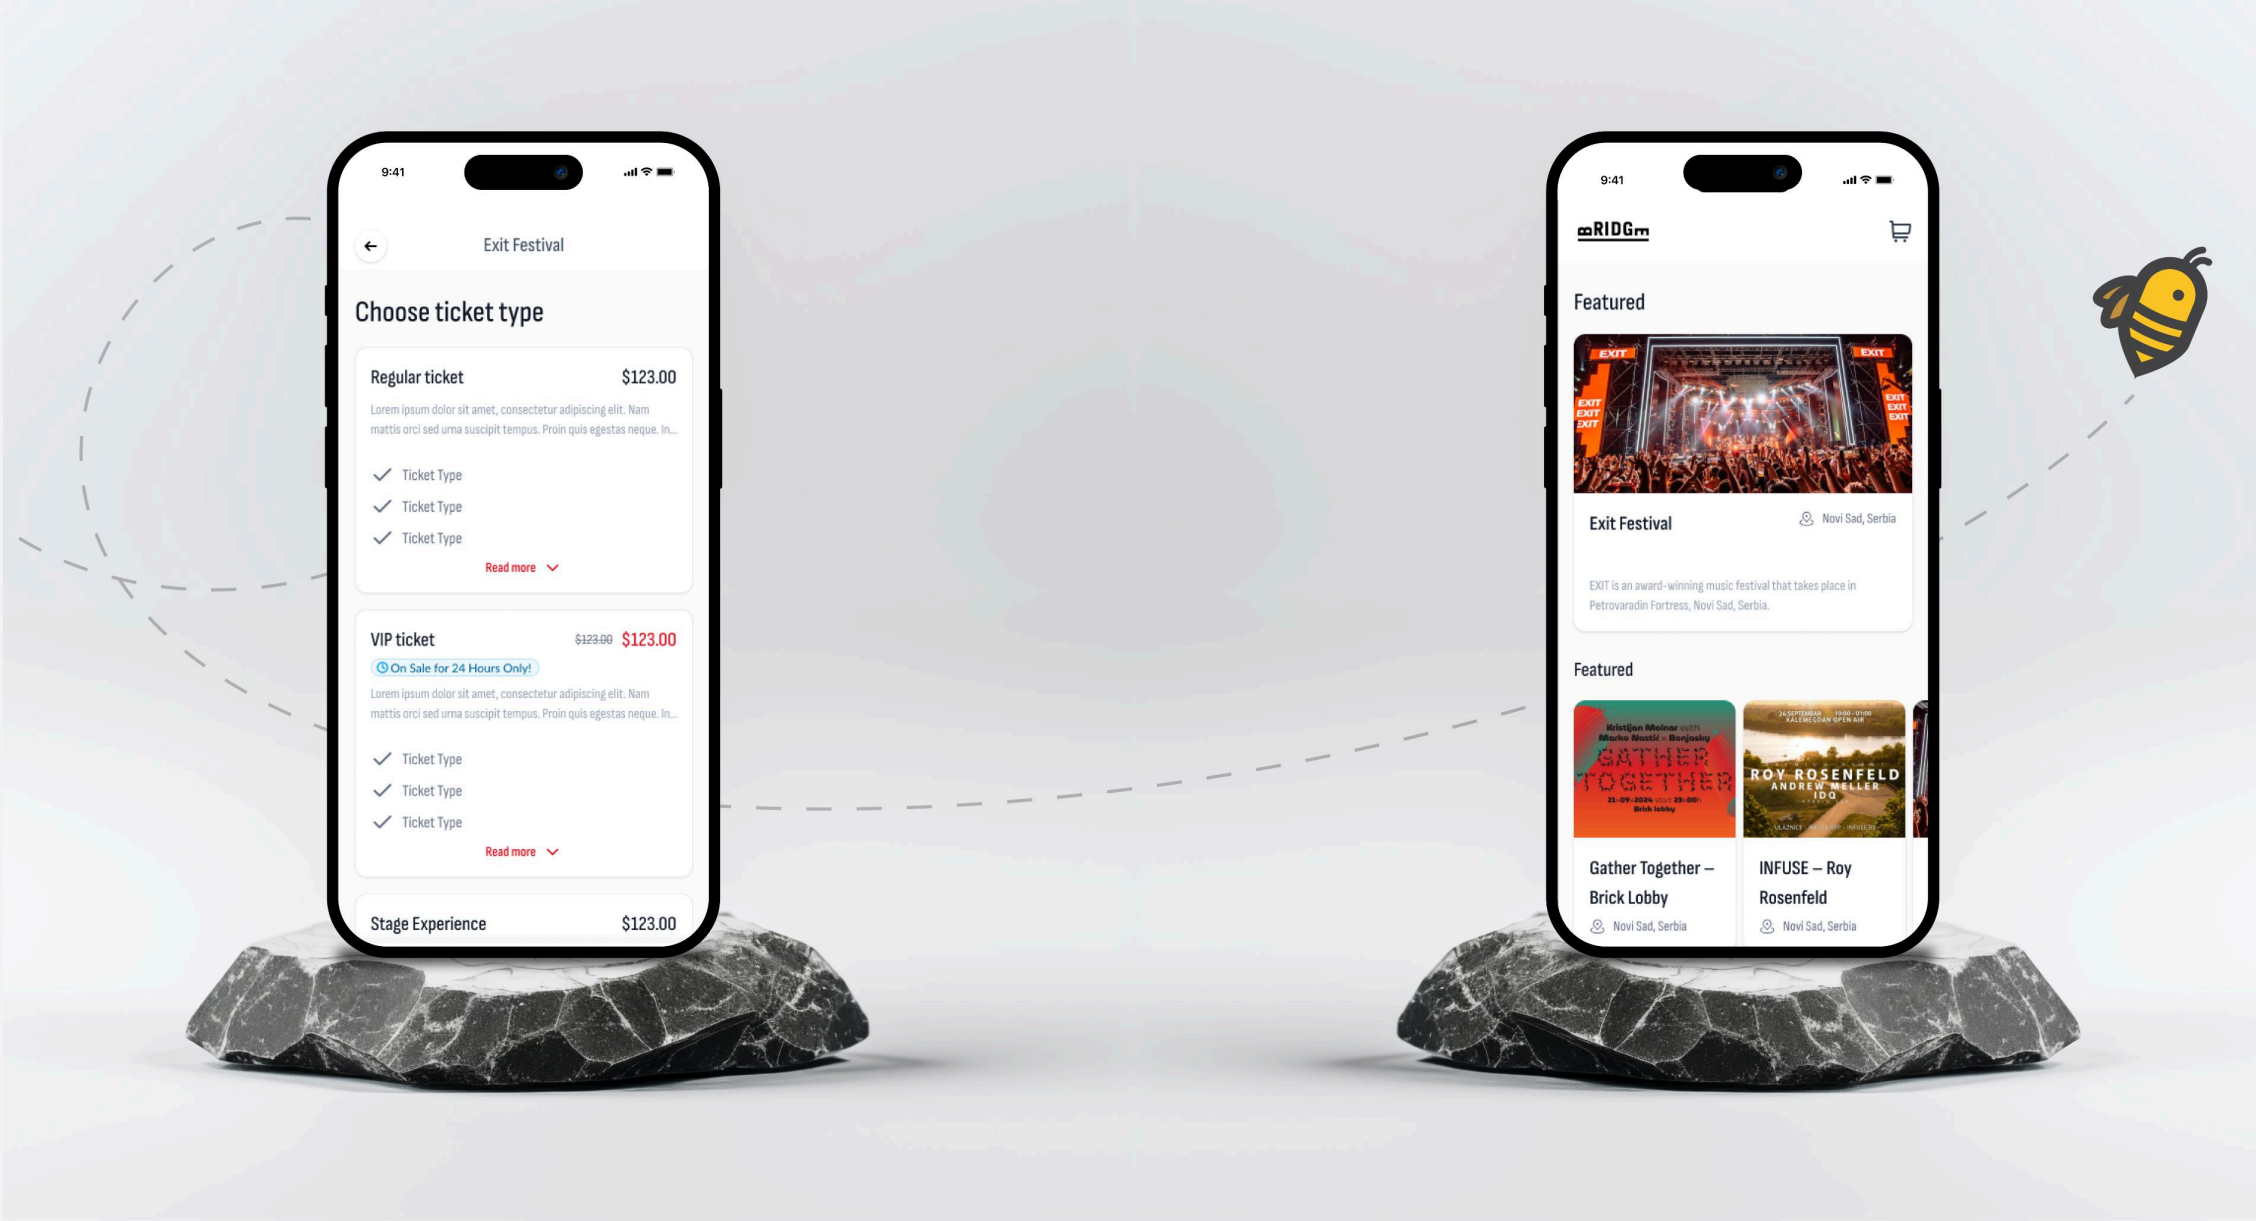
To make this vision real, at production scale and under festival-time pressure, Bee IT was brought in as the core engineering partner.

What (The Goals & Vision)

The objective was to design and build Bridge Festival App, a plug-and-play festival infrastructure that enables organizers to issue, distribute, and manage smart tickets without requiring Web3 or blockchain expertise.

The platform was envisioned as:

- a modular, white-label solution adaptable to different festivals
- a Web3-abstracted system, where blockchain complexity remains invisible to users
- a foundation for fan engagement, loyalty, and digital experiences beyond ticketing



EXIT Festival plans to deploy this solution across its network of more than 8 festivals, while its key advantage lies in the fact that any festival worldwide can adopt it as a globally scalable ecosystem with minimal integration effort.

How (Our Approach & Execution)

Bee IT assumed full technical ownership, delivering the platform from concept to live production.

01 End-to-End Product Engineering

There was no existing codebase.
Bee IT designed and implemented:

- **Full system architecture**
- **Backend and frontend applications**
- **Modular feature layers prepared for future expansion (social feed, matchmaking, group chats, map-based interactions)**

Every component of the platform was engineered and coded from scratch.

02 Smart Ticketing, Without the Complexity

Given the project's funding and Web3 requirements, Bee IT integrated Tixbase as a third-party smart ticketing and wallet provider.
The implementation delivers a plug-and-play smart ticketing layer, enabling:

- **Digital ticket issuance and lifecycle management**
- **Automatic wallet creation after first purchase**
- **NFT-based ticket ownership tied directly to each entry**
- **Customizable resale and transfer rules, helping curb scalping while enabling secondary market revenue**

All blockchain logic is abstracted away, allowing festivals and users to benefit from Web3 without technical overhead.

03 Payments, Infrastructure & Scalability

Bee IT independently set up and managed the entire cloud infrastructure:

- **AWS servers, databases, and environments**
- **Production-grade security and scalability**
- **High availability under real-time purchase traffic**

The platform integrates local payment providers, enabling smooth fiat onboarding while maintaining full compatibility with on-chain ticketing logic.

04 Seamless App Integration & Fan Engagement

Bridge Festival App was engineered to integrate seamlessly with existing festival operations, avoiding disruption to established workflows.
Beyond ticketing, the platform enables a growing set of fan engagement tools, including:

- **Exclusive access experiences (backstage passes, meet & greets)**
- **Digital collectibles and NFT memorabilia**
- **Loyalty-driven perks and rewards**
- **Social and community-driven interactions**

This transforms the app from a transactional tool into a continuous engagement ecosystem, before, during, and after the event.

05 First Bee IT PWA at Festival Scale

Bridge Festival App is Bee IT's first Progressive Web App (PWA), optimized for:

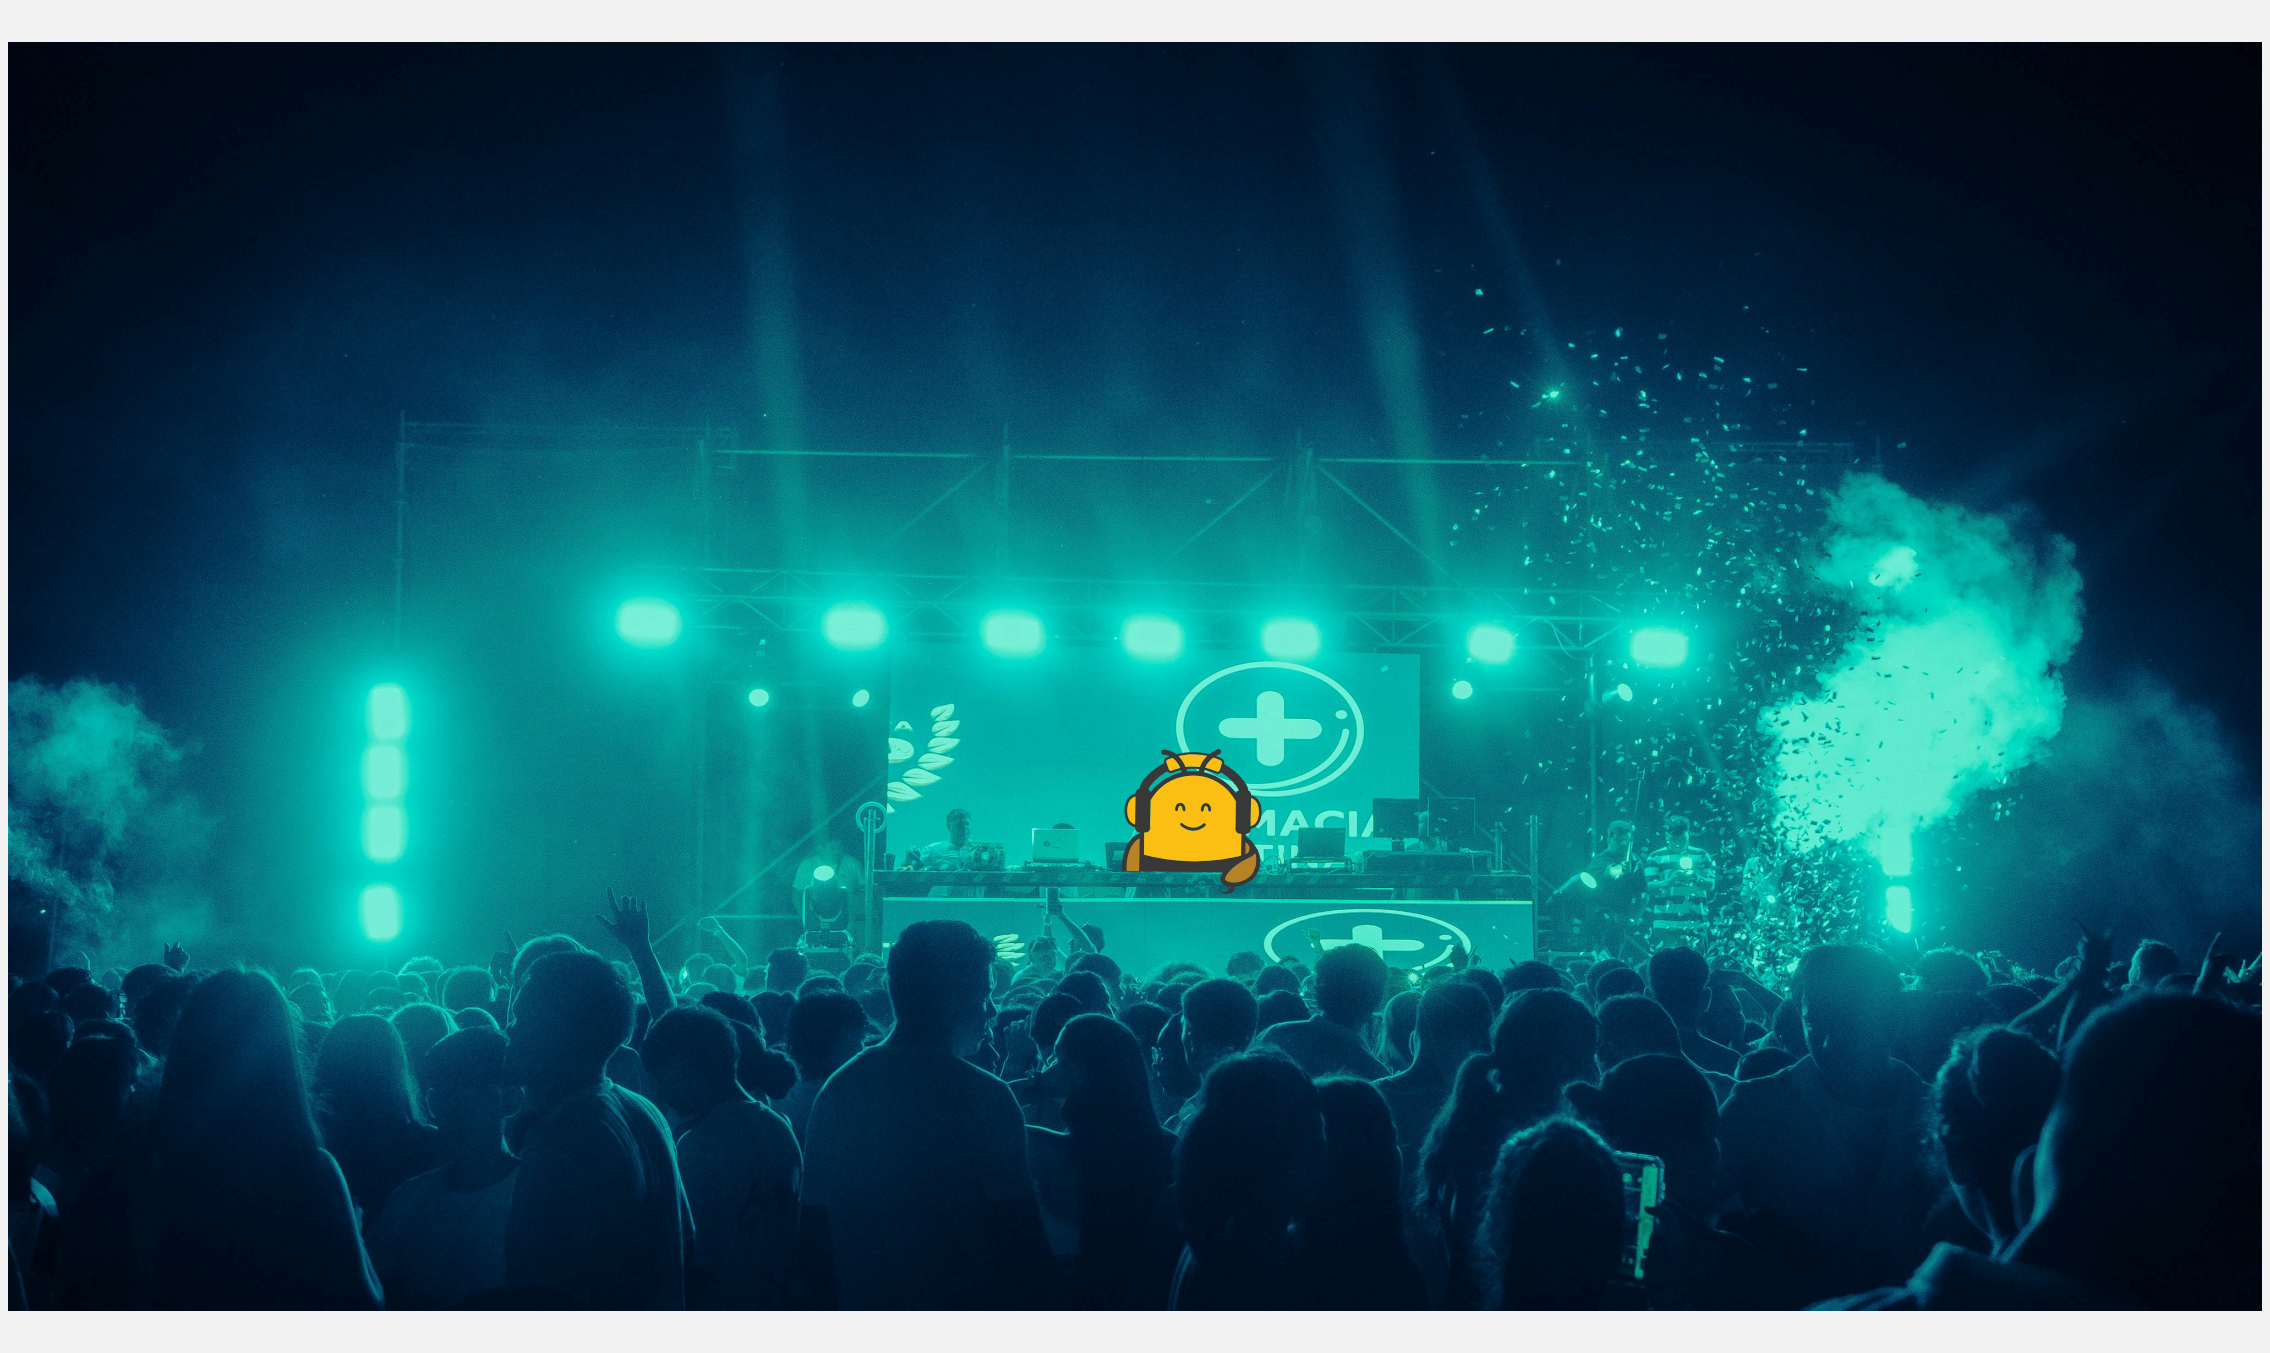
- **Mobile-first usage**
- **Fast load times**
- **Festival-scale concurrency**

The PWA architecture allowed rapid deployment and high performance under real-world festival conditions. Special recognition goes to our colleague **Milan Momčilović**, who led the PWA setup and optimization.

06 Go-Live Under Real Festival Conditions

Bee IT supported EXIT during the official festival launch:

- **The app went live on day one of EXIT Festival**
- **Ticket sales (donation-based in the initial phase) started immediately**
- **The platform operated reliably without critical issues during live usage**



Impact (The Outcomes)

01 Immediate Results

- Fully functional smart ticketing platform delivered on time
- First large-scale deployment of NFT-based ticketing at EXIT
- Stable infrastructure during live festival operations

02 Strategic Impact

By building on Avalanche's high-performance blockchain, the platform delivers:

- Lightning-fast transactions
- Low transaction fees suitable for high-volume ticketing
- Scalability required for global festival networks

03 EXIT is now positioned as:

- A pioneer in fraud-resistant, fan-first ticketing
- A technology hub capable of onboarding 20+ global festivals by 2025
- A wave maker for a borderless, on-chain festival economy

04 Bee IT Value Delivered

Through the Bridge Festival App, Bee IT demonstrated:

- The ability to build production-ready Web3 systems
- Expertise in smart ticketing, NFT infrastructure, and PWA architecture
- Strength in full-cycle product development, from architecture to live operations
- Capability to abstract complex technology into business-ready platforms

> *"Bee IT developed the Bridge app to power Exit Festival's next-generation ticketing experience. By combining PWA technology, WSPay integration, and Tixbase's crypto and NFT capabilities on Avalanche, the app makes purchasing and using tickets simple and future-ready, and has already engaged over 9,000 users."*
